

12/8/23

2. Input and Output Device

Q1 Draw the following Flow chart.
Computer System.

Chapter 2

class IX

Date / /

Page

Q2. Write Full Forms of chapter 2.

1. PMT (on Page 37)
2. CCD "
3. OCR Page 38
4. OMR "
5. MICR "
6. CAD 39
7. VDU 41
8. CRT "
9. LCD "
10. TFT "
11. LED 42
12. DTP 43
13. HDD 44
14. CD ROM 44
15. CD-R 44
16. CD-RW 44
17. DVD 45
18. PCB 46

Chapter 1.

Q3. Do Question number 7, and 8 of section 6. (Page 35) in your notes copy.

7. Difference between primary and secondary memory:

BASIS FOR COMPARISON	PRIMARY MEMORY	SECONDARY MEMORY
Basic	Primary memory is directly accessible by Processor/CPU.	Secondary memory is not directly accessible by CPU.
Altered Name	Main memory.	Auxiliary memory.
Data	Instructions or data to be currently executed are copied to main memory.	Data to be permanently stored is kept in secondary memory.

© Kips Learning Pvt. Ltd. 2020

Volatility	Primary memory is usually volatile.	Secondary memory is non-volatile.
Formation	Primary memories are made of semiconductors.	Secondary memories are made of magnetic and optical material.
Access Speed	Accessing data from primary memory is faster.	Accessing data from secondary memory is slower.
Access	Primary memory is accessed by the data bus.	Secondary memory is accessed by input-output channels.
Size	The computer has a small primary memory.	The computer has a larger secondary memory.
Expense	Primary memory is costlier than secondary memory.	Secondary memory is cheaper than primary memory
Memory	Primary memory is an internal memory.	Secondary memory is an external memory.

8. CPU stands for Central processing unit .It is also known as microprocessor or processor. A CPU is the brain of a computer. It is responsible for all the functions and processes performed by the computer. The three components of the CPU are following,

- a. Arithmetic Logic Unit (ALU) - It performs arithmetic calculations like as addition, subtraction, multiplication and division as well as comparisons.
- b. Control Unit (CU) - It controls and co-ordinates computer components. It extracts instructions from memory, decodes and executes them. It regulates the flow of information by sending and receiving signals to all other components of the computer.
- c. Memory Unit (MU) - It stores the data and instructions that are required by the processor.
